National Black HIV/AIDS Awareness Day 2024

The theme for this year's #NBHAAD is "Engage, Educate, Empower: Uniting to End HIV/AIDS in Black Communities."

February 7, 2024 By Trent Straube

Wednesday, February 7, marks National Black HIV/AIDS Awareness Day (#NBHAAD) 2024. This year's theme is, "Engage, Educate, Empower: Uniting to End HIV/AIDS in Black Communities." Search the hashtag online to fine countless awareness campaigns, educational events and other happenings. Several examples are included throughout this article.

Today is National Black HIV/AIDS Awareness Day (#NBHAAD). This year, we're elevating the theme, Engage, Educate,...

HIV disproportionately affects the African-American community. In 2021, Black Americans comprised 13% of the U.S. population but made up 40% of new HIV diagnoses that year. Similarly, they make up 40% of all people living with HIV in the nation, according to AIDSVu.com, which uses federal data to create interactive maps and sharable graphics about the HIV epidemic.

The site also includes a NBHAAD-related interview with Charles Stephens, the founder and executive director of The Counter Narrative Project, about changing the narrative fr Black gay and bisexual men.

Today is National Black HIV/AIDS Awareness Day! What new information or insight did you gain from this infographic? #NBHAAD

A few other data points included in AIDSVu's NHAAD graphics include:

- In 2021, fewer Black people (62%) living with HIV were virally suppressed than their white counterparts (72%).

- Black women experience even greater disparities in HIV-related health outcomes than Black men. The rate of Black women living with diagnosed HIV was 16.6 time that of white women in 2021.

- Disparities are higher in the South. In 2021, Black people accounted for nearly half of all new HIV diagnoses in the South (49%), despite accounting for 19% of the Southern population.

- Progress has been made, especially in testing. In 2021, Black people had the highest percentage of people that have ever been tested for HIV (56%) of any race/ethnicity. In comparison, the national average was just 35%.

- Despite accounting for 40% of new diagnoses in 2021, Black people represented 14% of PrEP users in 2022.

PrEP refers to pre-exposure prophylaxis, the daily pill or long-acting injectables that are highly effective at keeping HIV-negative people from contracting the virus.
