

‘I’ve Tried Everything’: Pandemic Worsens Child Mental Health Crisis

Federal data show a nationwide surge of kids in mental health crisis during the pandemic.

January 27, 2021 By Cory Turner, Christine Herman and Rhitu Chatterjee

A bag of Doritos, that’s all Princess wanted.

Her mom calls her Princess, but her real name is Lindsey. She’s 17 and lives with her mom, Sandra, a nurse, outside of Atlanta. On May 17, 2020, a Sunday, Lindsey decided she didn’t want breakfast; she wanted Doritos. So she left home and walked to Family Dollar, taking her pants off on the way, while her mom followed on the phone with police.

Lindsey has autism (NPR isn’t using last names to protect her privacy). It can be hard for her to communicate and navigate social situations. She thrives on routine, and gets special help at school. Or got help, before the coronavirus pandemic closed schools and forced tens of millions of children home. Sandra says that’s when their living hell started.

“It’s like her brain was wired,” she says. “She’d just put on her jacket, and she’s out the door. And I’m chasing her.”

On May 17, Sandra chased her all the way to Family Dollar. Hours later, Lindsey was in jail.

Lindsey is one of almost [3 million children](#) in the U.S. who have been diagnosed with a serious emotional or behavioral health condition. When the pandemic forced schools and doctors’ offices closed last spring, it also cut children off from the trained teachers and therapists who understand their needs.

As a result, many, like Lindsey, spiraled into emergency rooms and even police custody. Federal data show [a nationwide surge](#) of kids in mental health crisis during the pandemic — a surge that’s further taxing an already overstretched safety net.

‘Take her’

Even after schools closed, Lindsey would continue to wake up early, get dressed and wait for the bus. When it stopped coming, Sandra says, her daughter just started walking out of the house, wandering, a few times a week.

In those situations, Sandra did what many families in crisis tell NPR they've had to do since the pandemic began: race through the short list of places she could call for help.

First, her state's mental health crisis hotline. But they often put Sandra on hold.

"This is ridiculous," she says of the wait. "It's supposed to be a crisis team. But I'm on hold for 40, 50 minutes. And by the time you get on the phone, [the crisis] is done!"

Then there's the local hospital's emergency room, but Sandra says she had taken Lindsey there for previous crises and been told there isn't much they can do.

That's why, on May 17, when Lindsey walked to Family Dollar in just a red t-shirt and underwear, to get that bag of Doritos, Sandra called the last option on her list: the police.

Sandra arrived at the store before the police and paid for the chips. According to Sandra and police records, when an officer approached, Lindsey grew agitated and hit her mom on the back, hard.

Sandra says she explained to the officer: " 'She's autistic. You know, I'm OK. I'm a nurse. I just need to take her home and give her her medication.' "

Lindsey takes a mood-stabilizer, but because she left home before breakfast, she hadn't taken it that morning. The officer asked if Sandra wanted to take her to the nearest hospital.

The hospital wouldn't be able to help Lindsey, Sandra said. It hadn't before. "They already told me, 'Ma'am, there's nothing we can do.' They just check her labs, it's fine, and they ship her back home. There's nothing [the hospital] can do," she recalls telling the officer.

Sandra asked if the police could drive her daughter home, so the teen could take her medication, but the officer said no, they couldn't. The only other thing they could do, the officer said, was take Lindsey to jail for hitting her mom.

"I've tried everything," Sandra said, exasperated. She paced the parking lot, feeling hopeless, sad and out of options. Finally, in tears, she told the officers, "Take her."

Lindsey does not like to be touched and fought back when authorities tried to handcuff her. Several officers wrestled her to the ground. At that point, Sandra protested and says an officer threatened to arrest her too if she didn't back away. Lindsey was taken to jail, where she spent much of the night until Sandra was able to post bail.

Clayton County Solicitor-General Charles Brooks denies that Sandra was threatened with arrest and tells NPR, while Lindsey's case is still pending, his office "is working to ensure that the resolution in this matter involves a plan for medication compliance and not punitive action."

Sandra isn't alone in her experience. NPR heard similar stories from multiple families — stories of

calling in the police when a child was in crisis because caretakers didn't feel they had any other option.

'The whole system is really grinding to a halt'

Roughly [6% of U.S. children](#), ages 6 through 17, are living with serious emotional or behavioral difficulties, including children with autism, severe anxiety, depression and trauma-related mental health conditions.

Many of these children depend on schools for access to vital therapies. When schools and doctors' offices stopped providing in-person services last spring, kids were untethered from the people and supports they'd come to rely on.

"The lack of in-person services is really detrimental," says [Susan Duffy](#), MD, MPH, a pediatrician and professor of emergency medicine at Brown University. "So school-based services are one, but also in-person services in general are disrupted [by the pandemic]."

Marjorie, a mother in Florida, says her 15-year-old son has suffered during these disruptions. He has ADHD and oppositional defiant disorder, a condition marked by frequent and persistent hostility. Little things — like being asked to do school work — can send him into a rage, leading to holes punched in walls, broken doors and violent threats. (Marjorie asked that we not use her last name to protect her family's privacy.)

The pandemic has shifted both school and her son's therapy sessions online. But Marjorie says virtual therapy isn't working, because her son doesn't focus well during sessions and tries to watch TV instead. Lately, she has simply been cancelling them.

"I was paying for appointments and there was no therapeutic value," Marjorie says.

The issues cut across socioeconomic lines — affecting families with private insurance, like Marjorie, as well as those who receive coverage through Medicaid, a federal-state program that provides health insurance to lower-income people and those with disabilities.

In the first few months of the pandemic, between March and May 2020, children on Medicaid received [44%](#) fewer outpatient mental health services — including therapy and in-home support — compared to the same time period in 2019, according to the Centers for Medicare & Medicaid Services. That's even after accounting for increased telehealth appointments.

And while the nation's ERs have seen a decline in overall visits, there was a relative increase in mental health visits for kids in 2020 compared to 2019.

The Centers for Disease Control and Prevention found that, from April to October 2020, hospitals across the U.S. saw a [24% increase](#) in the proportion of mental health emergency visits for children ages 5 to 11, and a 31% increase for children ages 12 to 17.

"Proportionally, the number of mental health visits is far more significant than it has been in the

past,” says Duffy. “Not only are we seeing more children, more children are being admitted [to in-patient care].”

That’s because there are fewer outpatient services now available to children, she says, and because the children showing up at ERs “are more serious.”

This crisis is not only making life harder for these kids and their families, it’s stressing the entire health care system.

Child and adolescent psychiatrists working in hospitals around the country tell NPR that children are increasingly “boarding” in emergency departments for days, waiting for in-patient admission to a regular hospital or psychiatric hospital.

Before the pandemic, there was already a [shortage of in-patient psychiatric beds](#) for children, says [Christopher Bellonci](#), MD, a child psychiatrist at Judge Baker Children’s Center in Boston. That shortage has only gotten worse as hospitals cut capacity to allow for more physical distancing within psychiatric units.

“The whole system is really grinding to a halt at a time when we have unprecedented need,” Bellonci says.

‘A signal that the rest of your system doesn’t work’

Psychiatrists on the front lines share the frustrations of parents struggling to find help for their children.

Part of the problem is there have never been enough psychiatrists and therapists trained to work with children, intervening in the early stages of their illness, says [Jennifer Havens](#), MD, a child psychiatrist at NYU.

“Tons of people showing up in emergency rooms in bad shape is a signal that the rest of your system doesn’t work,” she says.

Havens says too often, services aren’t available until children are older — and in crisis. “Often for people who don’t have access to services, we wait until they’re too big to be managed.”

While the pandemic has made life harder for Marjorie and her son in Florida, she says it has always been difficult to find the support and care he needs. Last fall, he needed a psychiatric evaluation, but the nearest specialist who would accept her commercial insurance was 100 miles away, in Alabama.

“Even when you have the money or you have the insurance, it is still a travesty,” Marjorie says. “You cannot get help for these kids.”

Parents are frustrated, and so are psychiatrists on the front lines. [C.J. Glawe](#), MD, leads the psychiatric crisis department at Nationwide Children’s Hospital in Columbus, Ohio.

He says once a child is stabilized after a crisis, it can be hard to explain to parents that they may not be able to find follow-up care anywhere near their home.

“Especially when I can clearly tell you I know exactly what you need, I just can’t give it to you,” Glawe says, “it’s demoralizing.”

When states and communities fail to provide children the services they need to live at home, kids can deteriorate and even wind up in jail, like Lindsey. At that point, Glawe says, the cost and level of care required will be even higher, whether that’s hospitalization or long stays in residential treatment facilities.

That’s exactly the scenario Sandra, Lindsey’s mom, is hoping to avoid for her Princess.

“For me, as a nurse and as a provider, that will be the last thing for my daughter,” she says. “It’s like [state and local leaders] leave it to the school and the parent to deal with, and they don’t care. And that’s the problem. It’s sad because, if I’m not here...”

Her voice trails off a moment, tears welling.

“She didn’t ask to have autism.”

To help families like Sandra’s and Marjorie’s, advocates say all levels of government need to invest in creating a mental health system that’s accessible to anyone who needs it.

But given that many states have seen their [revenues drop](#) due to the pandemic, there’s a concern services will instead get cut — at a time when the need has never been greater.
